

The Evolving Roles of Informatics and Information Technology in Health Care

Edward H. Shortliffe, MD, PhD

Professor of Biomedical Informatics and

Senior Advisor to the Executive Vice Provost

College of Health Solutions, Arizona State University

Adjunct Faculties, Columbia University and Weill Cornell Medical College

Annual Meeting

Society for Technology in Anesthesia

Royal Palms Resort & Spa

Phoenix, AZ

January 8, 2014

ASU department of
biomedical informatics

ASU Health Solutions

What I Would Like to Discuss

- Reflections on the evolution of technologies in our society, to provide context for considering health information technology (HIT) and its future
- Discussion of the evolution of informatics as a discipline
 - Some words about nomenclature
 - Relationship of informatics to HIT
- Assessment of our current state
 - Some examples from anesthesiology
- Anticipating future directions

Analogy: Commercial Aviation

Roughly where we are today
in the evolution of health
information technology
relative to what we envision

Analogy: Evolution of Personal Computing Devices

Subsequently ..

- Network connectivity (Internet and wireless)
- Modern PCs, Macs, netbooks, etc.
- Smartphones
- Tablet computing
- Smart devices
- Personal devices
- And more to come .

The Evolving Paradigm

**President Bush calls for
universal implementation of
electronic health records

Subsequent Evolution

What Lies Ahead?

Historical Perspective

- Seminal article: Earliest broad recognition of statistical issues in diagnosis and the potential role of computers occurred in the late 1950s
 - “Reasoning foundations in medical diagnosis” by Ledley and Lusted
 - Appeared in Science in 1959
- Computers began to be applied in biomedicine in the 1960s
 - Most applications dealt with clinical issues, including diagnostic systems

department of
biomedical informatics

Health Solutions

A Discipline Emerges

- The word “informatics” has its roots in applications in clinical medicine
 - English term first coined by the medical informatics community in the late 1970s (borrowed from Europe)
- Data issues seemed “big” from the very beginning
 - Hospital information systems (1960s)
 - Early decision-support and expert systems (1970s)
 - Subsequent clinical research systems (1980s)
 - Human genome project (1990s)

But what exactly is informatics?

J Am Med Inform Assoc 2012;19(6):931-938

Perspective

AMIA Board white paper: definition of biomedical informatics and specification of core competencies for graduate education in the discipline

Casimir A Kulikowski,¹ Edward H Shortliffe,² Leanne M Currie,³ Peter L Elkin,⁴
Lawrence E Hunter,⁵ Todd R Johnson,⁶ Ira J Kalet,⁷ Leslie A Lenert,⁸
Mark A Musen,⁹ Judy G Ozbolt,¹⁰ Jack W Smith,¹¹ Peter Z Tarczy-Hornoch,⁷
Jeffrey J Williamson¹²

Abstract: The AMIA biomedical informatics (BMI) core competencies have been designed to support and guide graduate education in BMI, the core scientific discipline underlying the breadth of the field's research, practice, and education. ... The AMIA BMI analysis highlights the central shared set of competencies that should guide curriculum design and that graduate students should be expected to master.

AMIA's Definition (2012)

Biomedical informatics (BMI) is the interdisciplinary field that studies and pursues the effective uses of biomedical data, information, and knowledge for scientific inquiry, problem solving, and decision making, motivated by efforts to improve human health.

JAMIA 2012;19(6):931-938

department of
biomedical informatics

Health Solutions

Biomedical Informatics: Corollaries to the Definition

1. BMI develops, studies and applies **theories, methods and processes** for the generation, storage, retrieval, use, and sharing of biomedical data, information, and knowledge.
2. BMI builds on **computing, communication and information sciences** and technologies and their application in biomedicine.

department of
biomedical informatics

Health Solutions

Biomedical Informatics: Corollaries to the Definition

3. BMI investigates and supports reasoning, modeling, simulation, experimentation and translation across the **spectrum from molecules to populations**, dealing with a variety of biological systems, bridging basic and clinical research and practice, and the healthcare enterprise.
4. BMI, recognizing that people are the ultimate users of biomedical information, draws upon the **social and behavioral sciences** to inform the design and evaluation of technical solutions and the evolution of complex economic, ethical, social, educational, and organizational systems.

Health Solutions

No One Name Is Universally Accepted

- Medical informatics?
- Health informatics?
- Biomedical informatics?
- One solution:
 - I use unmodified “informatics” as much as possible when referring to the discipline, but use “biomedical informatics” when referring to the core science of our field
 - Avoid using “bioinformatics” to refer to the full discipline

Biomedical Informatics in Perspective

Characteristics of BMI Academic Units

- Imbued with a health sciences culture
- Driven by a desire to address perceived problems in the biomedical setting
- Applied work always important, but impressive basic/generalizable results
- Interdisciplinary nature leads to challenging partnership requirements, both for teaching and research
- Often poorly understood by colleagues in medical and health-professional world

An Optimistic Perspective

A spokeswoman from the Department of Health and Human Services has cited a Congressional Budget Office estimate that 90 percent of doctors would be using health IT by 2019, thanks to the stimulus bill

Anesthesia and Informatics/HIT

- Innovations and routine use in the area of patient monitoring
- Anesthesia-specific EMRs

The screenshot shows a web browser window with the address bar displaying 'www.softwareadvice.com/medical/ane'. The page title is 'Compare Anesthesiology EMR Software'. The page is managed by Kathleen Irwin, Market Research Associate, and was last updated on December 27, 2014. The page features a 'Top 10 Most Reviewed Anesthesiology EMR Software Systems' section with a 'Sort List By: Number of review' dropdown menu. A sidebar on the right encourages users to 'Find the right software systems based on your needs in 3 easy steps' and provides a link to 'We need a few details about your organization to start narrowing down the list:'.

The screenshot shows the Becker's ASC Review website. The navigation bar includes links for 'Becker's Healthcare', 'ASC Review', 'Hospital Review', 'Spine Review', 'Infection Control', 'Health IT & CIO', and 'CFO'. The main header features the 'BECKER'S ASC REVIEW' logo and a 'TelePREOP' logo. A sidebar on the right lists various resources: 'Print Issues', 'E-Weeklies', 'Infection Control E-Weeklies', 'Conferences', 'Webinars', 'Whitepapers', 'Multimedia', and 'Lists'. The main content area is titled 'Anesthesia' and features a photograph of a medical professional in a surgical setting. Below the photo, there is a section titled '5 Essential Smartphone Apps for Anesthesiologists' written by Taryn Tawoda on March 14, 2012. A search bar is visible on the right side of the page.

Anesthesia and Informatics/HIT

- Innovations and routine use in the area of patient monitoring
- Anesthesia-specific EMRs
- Some work on decision support
- Exceptional contributions in the area of simulation
 - Training and testing
 - Recognition of the role of cognitive science and innovative application of those methods and theories

Effects of Simulation Versus Traditional Tutorial-Based Training on Physiologic Stress Levels Among Clinicians: A Pilot Study

Choon Looi Bong, MBChB, FRCA;

Jenifer R. Lightdale, MD, MPH;

Meghan E. Fredette, BS;

Peter Weinstock, MD, PhD

Introduction: Emotionality and heightened anxiety during medical simulation encounters have been hypothesized to contribute to improved cognition and learning, but the overall stress "dose response curve" of experiential learning remains unclear. We sought to (1) identify the degree and time course of physiologic stress induced in physicians by simulation-based training (SBT), when compared with a traditional tutorial-based interactive-education training (IET) and (2) compare differences in stress responses to simulation activities among pediatric provider groups.

Method: Twenty-seven gastroenterology physicians were randomized among six crisis resource management courses taught by SBT versus IET. Eleven RNs and four

Personalized Medicine

Personalized Medicine: The Background

Personalized medicine is an extension of traditional approaches to understanding and treating illness. Since the beginning of the study of medicine, physicians have employed evidence found through observation to make a diagnosis or to prescribe treatment. In the past, this was presumably tailored to each individual, but personalized medicine makes treatment more specific.

In the modern conception of personalized medicine, the tools provided to the physician are more precise, probing not just the obvious, such as a tumor on a mammogram or cells under a microscope, but the very molecular makeup of each patient. Looking at the patient on this level helps the physician get a profile of the patient's genetic distinction, or mapping. By investigating this genetic mapping, medical professionals are then able to profile patients, and use the found information to plan out a course of treatment that is much more in step with the way their body works. Genomic medicine and personalized medicine use genetic information to prevent or treat disease in adults or their children.

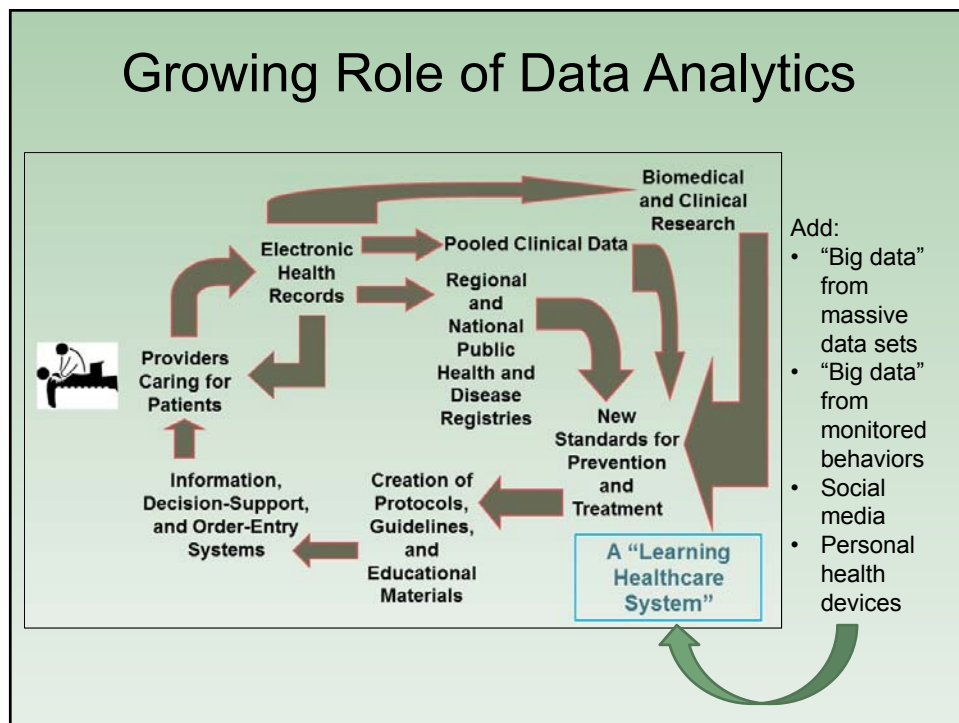

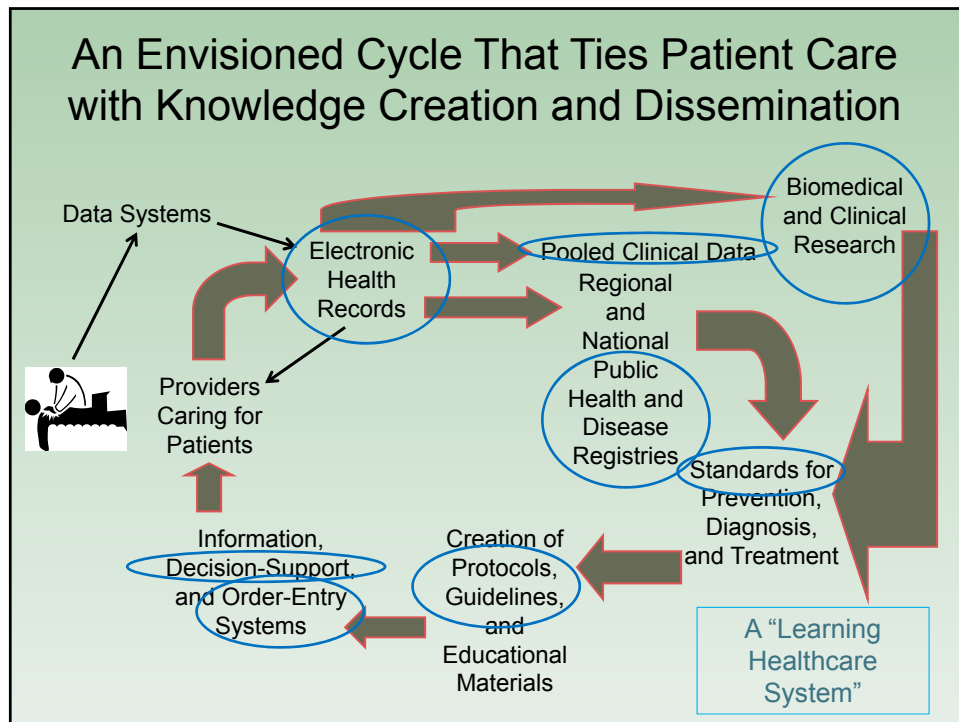

What Can We Gain from a Genetic Map?

Having a genetic map or a profile of a patient's genetic variation can then guide the selection of drugs or treatment processes. This can be used to minimize side effects or to create a strategy for a more successful outcome from the medical treatment. Helping the physician cover all the bases is imperative. Genetic mapping can also indicate the propensity to contract certain diseases before the patient actually shows recognizable symptoms, allowing the physician and patient to put together a plan for observation and prevention.

The ability to profile how genes are put together in sequence and expression level is helping to redefine the ways in which medical professionals classify diseases and discover treatments, allowing physicians to go beyond the "one size fits all" model that may be ineffective or have undesirable side effects. Through further organization, and the use of personalized medicine, medical professionals are developing many sub populations for complex diseases and physical conditions such as these.

POLICY FORUM

GENETICS

Genomic Research and Human Subject Privacy

Zhen Lin,¹ Art B. Owen,² Russ B. Altman^{1*}

Interest in understanding how genetic variations influence heritable diseases and the response to medical treatments is intense. The academic community relies on the availability of public databases for the distribution of the DNA sequences and their variations. However, like other types of medical information, human genomic data are private, intimate, and sensitive. Genomic data have raised special concerns about discrimination, stigmatization, or loss of insurance or employment for individuals and their relatives (1, 2).

Public dissemination of these data poses nonintuitive privacy challenges.

Unrelated persons differ in about 0.1% of the 3.2 billion bases in their genomes.

Trade-offs between SNPs and privacy.

Genomic data has led to a search for new technologies. However, the hurdles may be greater than had been suspected. For example, one approach to protecting privacy is to

mask genetic data will be provided unless a user can demonstrate that he or she is associated with a bona fide academic, industrial, or governmental research unit and agrees to our usage policies (including audit of data access) (10). Although this does not prevent data abuse, it provides a way to monitor usage.

Social concerns about privacy are intimately connected to beliefs about benefits of research and trustworthiness of researchers and governmental agencies. In the United States, the Health Insurance Portability and Accountability Act of 1996 (HIPAA) and the associated Privacy Rules of 2003 (11) generally forbid sharing identifiable data without patient consent. However, they do not specifically address use or disclosure policies for human genetic data. Recent debates in Ireland, Estonia, Britain, and elsewhere (12–15), reveal a range of views on the threats posed by genetic information. The United States may be at one end of this spectrum, as its citizens seem to strongly desire health privacy. Whatever the setting, we recommend explicit

Individual Privacy in the Era of Genomic Medicine

Science 2004;305(Jul 9);183

New issue: Concern is not what is currently true but what might be true in the future (for individual or offspring)

New Needs for Decision Support

Opportunity
For New Research

How to order
How to interpret
How to counsel

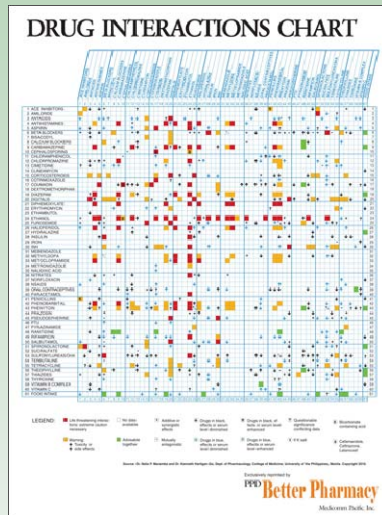

Decision
Support

Data Analytics Example: Pooled EHR Data and “Big Data” for Drug Safety

Drug-Drug Interactions

How are new drug-drug interactions suspected, investigated, and proven?

By clinical observation, or:

Pairs of drugs associated with clinical side effects

Data Mining for Drug Surveillance

Detecting drug interactions from adverse-event reports: interaction between paroxetine and pravastatin increases blood glucose levels.

Tatonetti NP, Denny JC, Murphy SN, Fernald GH, Krishnan G, Castro V, Yue P, Tsao PS, Kohane I, Roden DM, Altman RB.

Clin Pharmacol Ther. 2011 Jul;90(1):133-42

- Database: the US Food and Drug Administration's (FDA's) Adverse Event Reporting System (AERS)
- Focus on side-effect profiles involving blood glucose (sugar) control
- Found a surprisingly strong signal when patients were receiving two drugs: pravastatin (for lowering lipids [fats] in the blood) and paroxetine (an antidepressant)
- Found that pravastatin and paroxetine, when administered together, interacted to elevate blood glucose
- Affected individuals with or without prior diabetes diagnosis
- Neither drug administered alone was associated with such changes in glucose levels
- The effect was not found in patients taking both a different lipid-lowering agent or a different antidepressant

Might There Be Another Approach?

- Individuals who experience clinical symptoms often explore them using Internet search engines
- They may also search for information on drugs they are taking
- Might there have been a drug interaction “signal” for paroxetine and pravastatin contained in Web searches even before the diabetes phenomenon had been discovered?

department of
biomedical informatics

Health Solutions

“Big Data” Example

Web-scale pharmacovigilance: listening to signals from the crowd

Ryen W White, Nicholas P Tatonetti, Nigam H Shah, Russ B Altman, Eric Horvitz
J Am Med Inform Assoc 2013;20:404-408

- Investigators hypothesized that Internet users may provide early clues about adverse drug events via their online information-seeking
- Conducted a large-scale study of Web search log data (82 million searches) gathered during 2010.
- Focused on the specific drug pairing of **paroxetine** and **pravastatin**, whose interaction was reported to cause hyperglycemia *after* the time period of the online logs used in the analysis
- Found that anonymized signals on drug interactions can be mined from search logs (and that the specific interaction could have been predicted in advance of the publication previously described)
- Conclude that logs of the search activities of populations of computer users can contribute to drug safety surveillance

Glimpses of the Future (Research Agenda)

- Decision support that is aware of complex clinical contexts
 - Models of patients and of the care process
 - Identification of context-specific information or knowledge needs
- Better integration of systems (and transferability of decision-support capabilities between systems)
- Integration of data from personal devices
- Translation of terminology to standards
- User education and engagement (including patients)

2014 Standouts in Tech: Drones, Virtual Reality, Instant Translation and A.I.

Personal Tech, New York Times, December 31, 2014 (Farhad Manjoo)

- DJI INSPIRE 1: a remote-controlled quadricopter with camera
- SKYPE TRANSLATOR: performs near-instantaneous voice translation between people speaking English and Spanish
- GOOGLE'S IMAGE SUMMARIES: artificial intelligence project that can look at an image consisting of common items and describe, in comprehensible English words, what's going on in the picture
- OCULUS RIFT'S CRESCENT BAY: virtual-reality headset can track a user's head in a complete 360-degree swivel, allowing for a sense of being immersed in a picture without motion sickness

biomedical informatics

Health Solutions

A Chip In The Head (C/Net: October 28, 2013)

- In a bid to improve the mental health of soldiers and veterans, DARPA has launched a \$70 million project to create an implant that tracks neuron activity and provides quantifiable brain data
- Project is being called the Systems-Based Neurotechnology for Emerging Therapies (SUBNETS)
- Goal is to be able to monitor the "mental health" of soldiers and veterans
- DARPA's device will be similar to deep brain stimulation, but rather than targeting one specific symptom, it will be able to monitor and analyze data in real time and issue a specific intervention according to brain activity
- One prediction: Brain Implants Will Be Connecting People To The Internet By The Year 2020

department of
biomedical informatics

Health Solutions

Conclusions

A major constraint in making progress is the availability of individuals well trained at the intersection of computer science, information management, and clinical medicine

- Growing number of educational programs in biomedical informatics (MS and PhD levels, plus fellowships for health professionals)
- Growing number of training programs in applied health information technology
- Appointment of a CMIO (Chief Medical Information Officer) in a growing number of organizations
- Creation of ABMS-approved subspecialty in clinical informatics for physicians (first diplomats in 2013)

department of
biomedical informatics

Health Solutions

A Final Point

There are limitations to current systems (including EHRs and decision-support systems), but progress over time is clear and imperfect systems still have value

Further progress depends on more informatics expertise and on informed feedback into research, design, and implementation of evolving systems
