Difficult Airway Management

Low Frequency-High Stakes Events

- ❁ Difficult airway patients present and difficult airway emergencies require interventions that we use infrequently
- ❁ Type 1: Medical comorbidities and trauma can create emergent anticipated difficult airways (Angioedema, c-spine instability).
- ❁ Type 2: 1-3% of all routine airways are unanticipated difficult airway of those there is a subset of failed airways
- ❁ Physicians preparation
 - ❁ Manage emergency difficult airway situations
 - ❁ Unexpectedly in Emergency Departments, ICUS, OR and medical Floors.
 - ❁ Multiple tools and techniques
 - ❁ Surgical airways

EDITORIAL

Is it time for airway management education to be mandatory?

VHA DIRECTIVE 2012-032

October 26, 2012

OUT OF OPERATING ROOM AIRWAY MANAGEMENT

1. PURPOSE: This Veterans Health Administration (VHA) Directive addresses the appropriate competencies of providers who perform urgent and emergent airway management outside of VHA facility operating rooms; it addresses required techniques to confirm successful endotracheal tube placement and required documentation when a patient has been determined to have a difficult-to-intubate airway. **AUTHORITY:** Title 38 United States Code 7301(b).

Gaming to Change Clinical Behavior

- ❁ In 2005 Stokes [6] defined serious games as “games that are designed to entertain players as they educate, train, or change behaviour.”

Figure 1: The computer game spectrum.

☐ Game-based mass casualty burn training.

Simulation vs Gaming

Criteria	Traditional Simulation	Gaming
Cost	Development and Ongoing Time Expense	Development Fixed
Distribution & Self Paced Learning	Fixed locations Fixed times	To all computer terminals At the learners convenience
Standardization Of material delivery and	Requires Train the Trainer Difficult to validate	Assurance that the training program is the same for all learners
Metrics (Use and learner behavior)	Additional resources Difficult to standardize	Data collection can be programed with statistical package

What Behavior Needs Changing and to what?

- ✿ Front of neck access
- ✿ Situational Awareness
- ✿ Fixation error
- ✿ Team training
- ✿ Standard cognitive model by use of clear cognitive aid.

Cricothyrotomy Front of Neck Access (FONA)

The great airway debate: is the scalpel mightier than the cannula?

P. A. Baker^{1,2,*}, E. P. O'Sullivan³, M. S. Kristensen⁴ and D. Lockey^{5,6}

Difficult Airway Algorithm and Rescue Cricothyrotomy (DAARC)

- ❁ To reduce patient morbidity and mortality associated with difficult and failed airways
- ❁ VA developed Difficult Airway Algorithm and Rescue Cricothyrotomy (DAARC)
 - ❁ An interdisciplinary educational program (EM, ANE, ICU)
 - ❁ ~146 hospital, 8.9 million patient national VA system
 - ❁ Wide geographic area
 - ❁ Mastery-based education
 - ❁ Standardized deliberate practice for formative phase
 - ❁ Standardized simulation assessed deliberate practice summative phase.
 - ❁ Cost

Design Plan from the Outset

- ✿ Education Plan with CME credit
- ✿ Composite program video didactics, formative and summative serious games, and a hands on simulation workshop
- ✿ Uniform Difficult Airway Algorithm and standardized Cognitive aid selection to create common language and remove communication barriers.
- ✿ Cognitive aid selection that is acceptable to stake holders is a critical aspect of plan.
- ✿ Selection of evidence based and most direct techniques for surgical airway. Reviewed many and then made modification that were then trialed in 100s of hands on simulation.

VA Educational Serious Games Innovations

- ✿ Critical performance gap EES turned to serious, game-based learning products
 - ✿ Game thinking to immerse learners
 - ✿ Motivate action
 - ✿ Solve problems
 - ✿ Promote learning with formative and summative feedback
- ✿ Interactive immersive digital gaming technology
 - ✿ Game-based learning recreates real-world contexts, events and tasks
 - ✿ Focuses on specific learning goals, objectives and competency-based training
 - ✿ For anywhere or anytime medical health care training
 - ✿ Validated in-game assessments
 - ✿ Decreased financial burden of VHA-wide mandatory training

DAARC Hybrid Blended Learning System

- ✿ Difficult Airway Identification and Vortex cognitive aid “videocast”
- ✿ Cricothyrotomy procedure training video
- ✿ Four scenario-based video simulation demonstrations with accompanying audio discussions
- ✿ Four formative serious game scenarios
- ✿ Eight summative serious game scenarios
- ✿ Local facility manikin didactic & psychomotor skills simulations (TBD)

DAARC Virtual Game

- ❁ DAARC virtual game incorporates a formative and summative Games
- ❁ Progressive learning opportunities built into four layered serious games
 - ❁ With the completion of each Formative Game an additional clinical technique is added to learners repertoire
 - ❁ The use of the cognitive aid is introduced and use of it is necessary to pass though the levels
 - ❁ Physiology and education incorporated in formative phase
 - ❁ The use of new standard monitoring incorporated in formative phase
 - ❁ Learner may opt to repeat Formative Games
- ❁ After completing Formative Game the learner may choose to go forward to Summative Games or review instructional videos, simulation scenario videos or podcasts
- ❁ Training culminates with four engaging summative games that are scored to ensure transfer of training
- ❁ If the learner does not pass the four Summative Games they are given a second opportunity with four new Summative Games (or Formative)

Vortex Approach Airway Cognitive Aid

- ✿ Conceived in 2008 by Dr. Nicholas Chrimes, an Australian anaesthetist
- ✿ Universal and consistent approach taught to all staff involved in airway management
- ✿ Supported by a “high stakes cognitive tool”
- ✿ Single tool applicable to any airway crisis
- ✿ Readily utilized in a stressful situation by all team members
- ✿ Vortex is a flexible cognitive aid, rather than progression through a linear algorithm

The Vortex Cognitive Aid

The Vortex

For Each NSA Technique Consider:

1. Manipulations:
 - Head & Neck
 - Larynx
 - Device
2. Adjuncts
3. Size/Type
4. Suction/O₂ Flow
5. Muscle Tone

MAXIMUM THREE TRIES AT EACH NON-SURGICAL AIRWAY TECHNIQUE
AT LEAST ONE TRY SHOULD BE HAD BY MOST EXPERIENCED AVAILABLE CLINICIAN

Difficult Airway Algorithm & Rescue Cricothyrotomy

DAARC

DAARC Game Interface

The interface displays a patient's face with an open mouth, showing the tongue and throat. A large, tilted text box contains the following instructions:

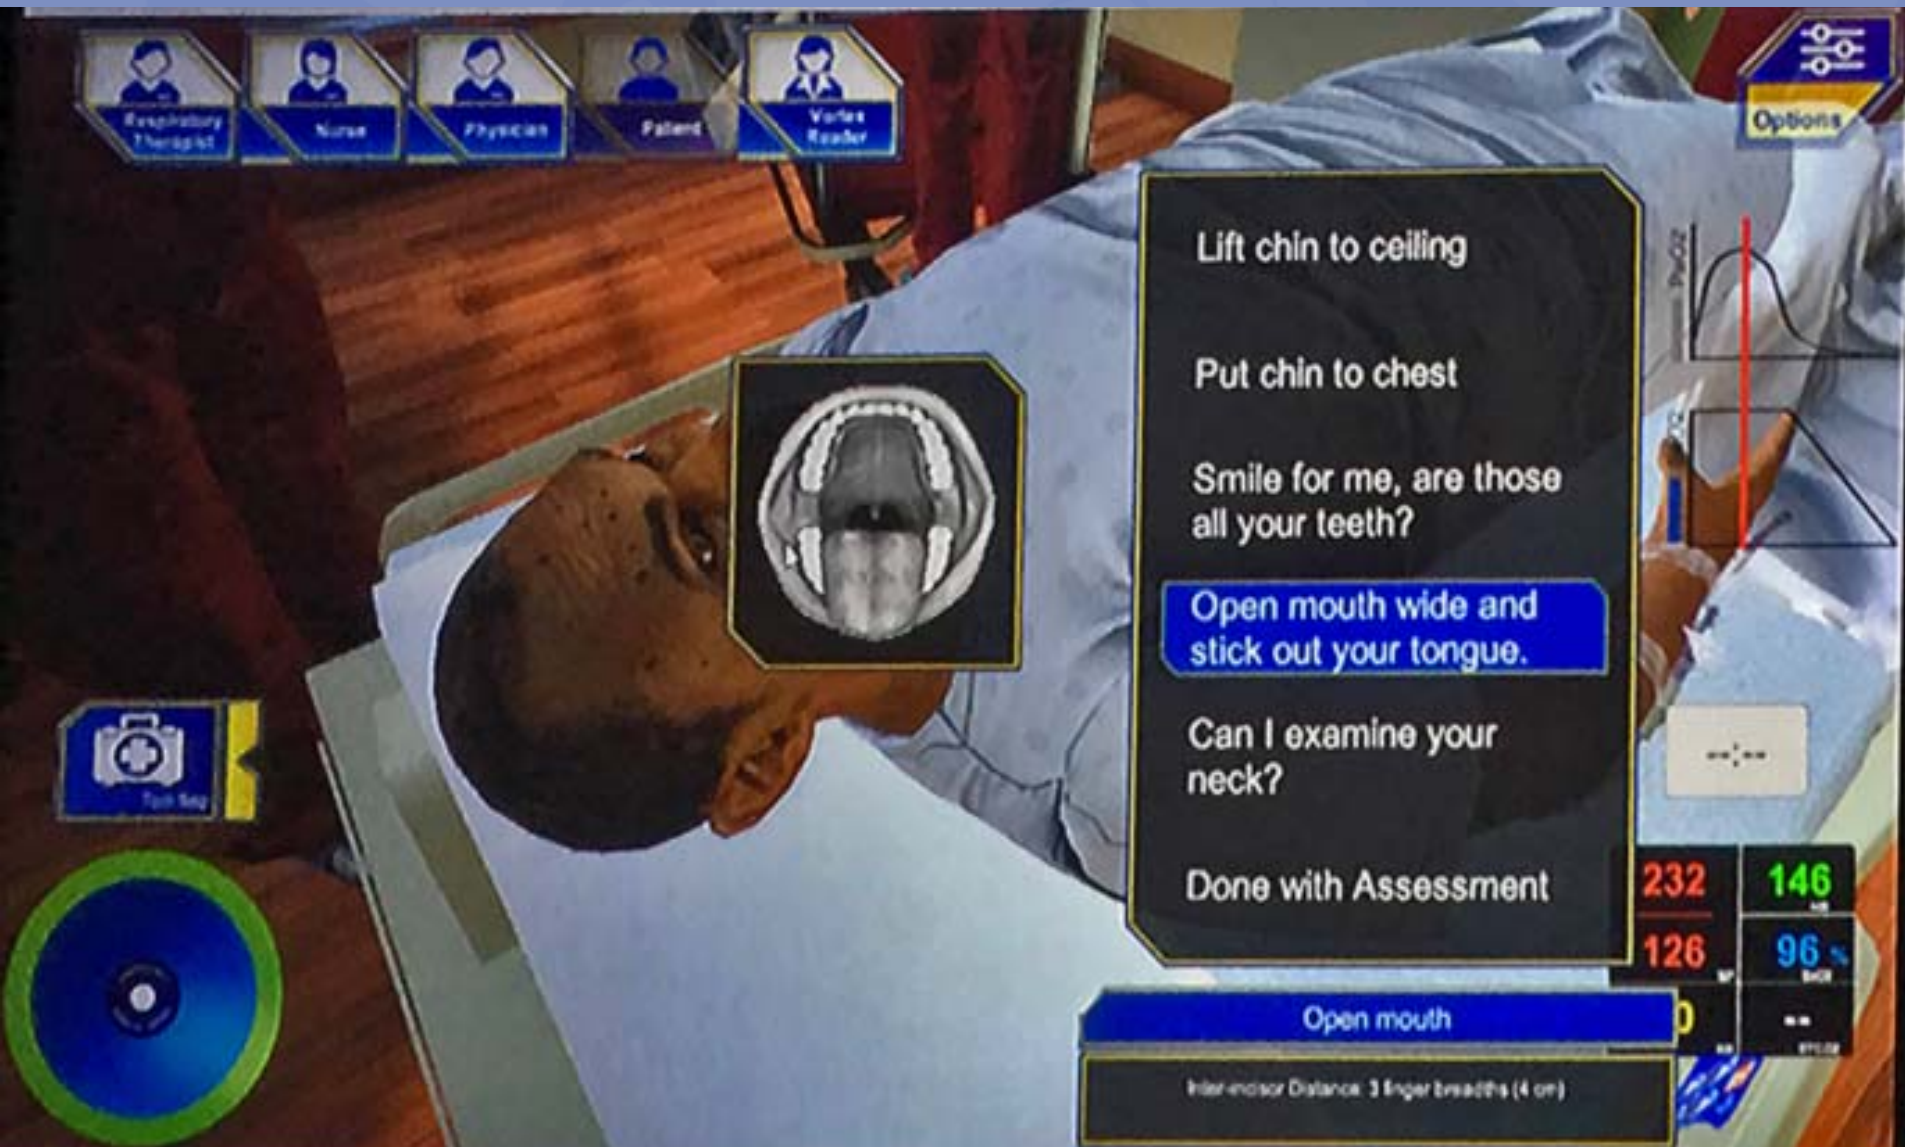

- Lift chin to ceiling
- Put chin to chest
- Smile for me, are these all your teeth?
- Open mouth wide and stick out your tongue.
- Can I examine your neck?
- Done with Assessment

A mouse cursor is pointing at the "Done with Assessment" button. The interface also includes a top navigation bar with icons for RESPIRATORY THERAPIST, NURSE, PHYSICIAN, PATIENT, and READER. On the left, there are icons for BVM, ETT, LMA, CRIC, and a Tool Bag. On the right, there are two graphs showing PeO_2 and SeO_2 over time, a timer showing 02:00, and a vital signs display.

DAARC: Patient Initial Assessment

Alpha Test DAARC Game

Videos of the Game

Difficultties

- ✿ SME Time
- ✿ Need for multiple face to face meetings
- ✿ Physiology generator
- ✿ Testing and validation of educational tool

The Future...

- ✿ Validation of education tool
 - ✿ “Training Effectiveness”
- ✿ Virtual Reality (VR)
 - ✿ Goggles and gloves with haptic feedback
- ✿ Augmented Reality (AR)
 - ✿ Goggles that overlay items in the real environment. This could provided in situ simulation. The best of both worlds.
- ✿ The VA Employee Education System

They are considering a VR version of DAARC

Virtuous interlocking cycles of systems

Thank You!
